Agricultural Marketing Service
and
National Agricultural Statistics Service

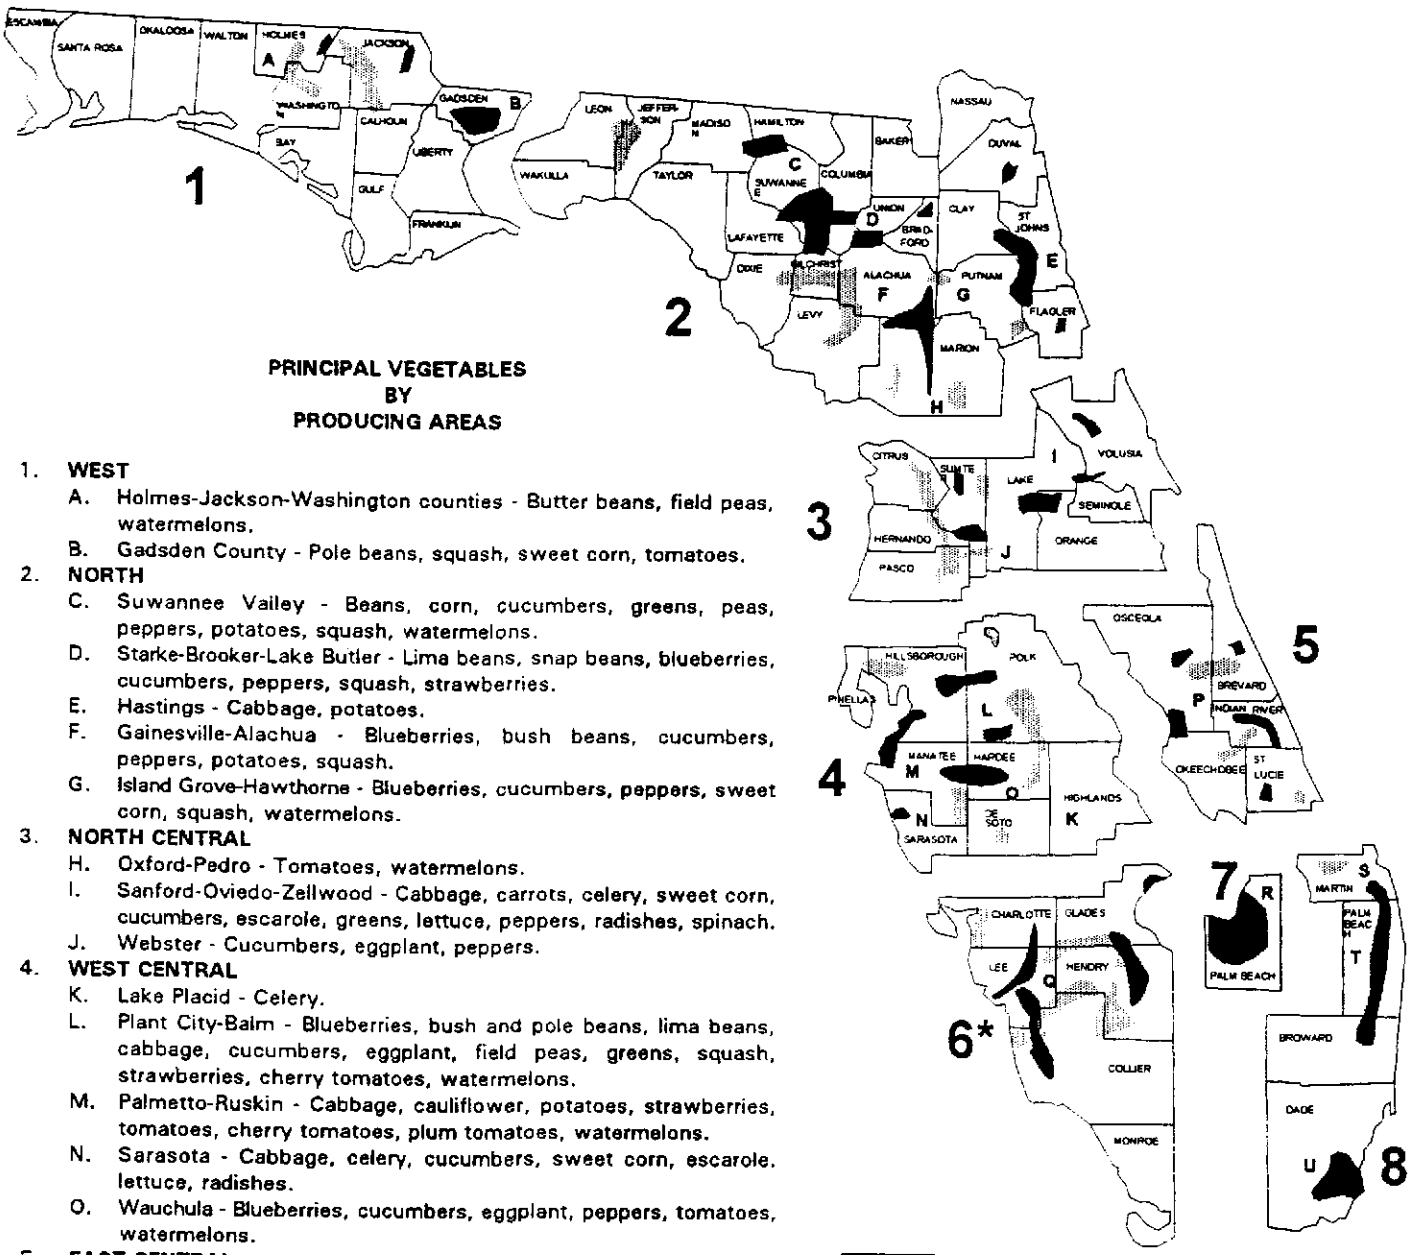
ACKNOWLEDGMENT

The acreage, production, and value statistics in this bulletin are official State and USDA estimates prepared by the Florida Agricultural Statistics Service. Extended commodity coverage and county and area detail were made possible through the participation of the Department of Food and Resource Economics, University of Florida, in the estimating program. The Bureau of State Farmers' Markets, Florida Department of Agriculture, and the County Extension Agents of the Cooperative Extension Service were also very helpful in supplying area and county information. Shipment statistics were provided by the Market News Section of the Florida Department of Agriculture and the USDA Agricultural Marketing Service.

Growers, shippers, and processors volunteered most of the basic data used in developing these statistics. The public spirited cooperation of these individuals and groups is appreciated. The Florida Tomato Committee has provided valuable assistance and data throughout the season. Sales agencies and transportation firms provided additional data. The Florida Fruit and Vegetable Association provided the cover design.

Field personnel, A.J. Wilson, Parrish; E.J. Hutchins, Deerfield Beach; Charles Robertson, Homestead; Carl Ouzts, Orlando; and Robert McClelland, Immokalee, collected much of the basic acreage and production data in this bulletin. This report was assembled by Wade Adams, Shirley Zonner, and Bernie Albrecht of the Florida Agricultural Statistics Service, and Phil Montgomery, of the Market News Section. The authors also wish to thank Marcelo Diaz, Kitty Hildreth, Pat Quittence, Iris Solis, and others of the Florida Agricultural Statistics Service who assisted in compiling and preparing this report.

Published May 1998



PRINCIPAL VEGETABLES BY PRODUCING AREAS

1. **WEST**
   - A. Holmes-Jackson-Washington counties - Butter beans, field peas, watermelons.
   - B. Gadsden County - Pole beans, squash, sweet corn, tomatoes.
2. **NORTH**
   - C. Suwannee Valley - Beans, corn, cucumbers, greens, peas, peppers, potatoes, squash, watermelons.
   - D. Starke-Brooker-Lake Butler - Lima beans, snap beans, blueberries, cucumbers, peppers, squash, strawberries.
   - E. Hastings - Cabbage, potatoes.
   - F. Gainesville-Alachua - Blueberries, bush beans, cucumbers, peppers, potatoes, squash.
   - G. Island Grove-Hawthorne - Blueberries, cucumbers, peppers, sweet corn, squash, watermelons.
3. **NORTH CENTRAL**
   - H. Oxford-Pedro - Tomatoes, watermelons.
   - I. Sanford-Oviedo-Zellwood - Cabbage, carrots, celery, sweet corn, cucumbers, escarole, greens, lettuce, peppers, radishes, spinach.
   - J. Webster - Cucumbers, eggplant, peppers.
4. **WEST CENTRAL**
   - K. Lake Placid - Celery.
   - L. Plant City-Balm - Blueberries, bush and pole beans, lima beans, cabbage, cucumbers, eggplant, field peas, greens, squash, strawberries, cherry tomatoes, watermelons.
   - M. Palmetto-Ruskin - Cabbage, cauliflower, potatoes, strawberries, tomatoes, cherry tomatoes, plum tomatoes, watermelons.
   - N. Sarasota - Cabbage, celery, cucumbers, sweet corn, escarole, lettuce, radishes.
   - O. Wauchula - Blueberries, cucumbers, eggplant, peppers, tomatoes, watermelons.
5. **EAST CENTRAL**
   - P. Ft. Pierce - Tomatoes, watermelons.
6. **SOUTHWEST**
   - Q. Snap beans, sweet corn, cucumbers, eggplant, sweet and hot peppers, potatoes, squash, tomatoes, cherry tomatoes, plum tomatoes, watermelons.
7. **EVERGLADES**
   - R. Bush beans, cabbage, celery, Chinese cabbage, sweet corn, escarole, greens, lettuce, potatoes, radishes.
8. **SOUTHEAST**
   - S. Martin County - Cabbage, potatoes, tomatoes, watermelons.
   - T. Pompano - Bush beans, lima beans, sweet corn, cucumbers, eggplant, sweet and hot peppers, squash, tomatoes, cherry tomatoes, plum tomatoes.
   - U. Homestead - Bush and pole beans, cabbage, sweet corn, eggplant, okra, pickles, potatoes, squash, strawberries, tomatoes, cherry tomatoes, plum tomatoes.

Commercial Vegetables
* Vegetables are grown in several areas of Charlotte, Collier, Glades, Hendry, and Lee counties.

Watermelons

Usual dates for planting and harvesting vegetables, melons, potatoes, and strawberries

Crop	Planting Dates [1/]	Usual Harvest Dates		
		Begins	Most active	Ends
Snap Beans [2/]	Aug 15 - Apr 1	Oct 15	Nov 1 - May 1	June 15
Blueberries		Apr 15	May 1 - May 25	June 10
Cabbage	Sep 1 - Mar 15	Oct 25	Jan 1 - Apr 15	Jun 15
Carrots	Aug 15 - Feb 15	Nov 1	Dec 15 - May 25	June 10
Cantaloupes	Jan 15 - Mar 15	Mar 10	May 15 - Jun 20	Jul 10
Cauliflower	Sep 15 - Jan 1	Dec 15	Jan 1 - Mar 15	Apr 15
Celery	Aug 1 - Apr 15	Oct 25	Dec 15 - Jun 1	Jul 10
Chinese Cabbage	Sep 1 - Apr 1	Oct 20	Nov 15 - May 15	Jun 1
Sweet corn	Jul 25 - May 10	Sep 25	Nov 15 - Jun 15	Jun 15

ITEM PAGE

DEFINITIONS AND EXPLANATIONS

SEASONAL GROUPS--State level estimates for most crops are estimated on a six month seasonal basis. These statistics are published in January. The periods are for the crop year July through December and January through June. The two six month periods were combined in this publication into a crop year total for all crops. Production sold or utilized is shown by months.

PLANTED ACREAGE is the total acreage which has been planted for harvest during the crop year. Acreage lost and replanted to the same crop in time for harvest in the same quarter is counted only once. Acreage harvested and planted again to the same crop is counted twice.

HARVESTED ACREAGE is the acreage partially or completely harvested. Acreage lost before or at maturity through natural or economic causes is not included in the acreage for harvest.

YIELD is the average production per harvested acre of merchantable quality harvested and sold or utilized for human consumption.

PRODUCTION is the quantity actually harvested and sold or utilized for human consumption.

UNIT VALUE for fresh market sales is the equivalent price received, f.o.b. shipping point basis and encompasses all grades and sizes marketed or utilized. Included are packing charges, selling charges, precooling, top ice, or other costs which contribute to the value of the product at shipping point. The value per unit for quantities sold to processors is the average value paid for usable quantities, on a "delivered to plant door" basis. This value includes transportation and other normal costs incident to delivery at plant door.

TOTAL VALUE is the equivalent value of production sold or utilized based on the unit value. Cullage and other quantities not sold or utilized because of natural or economic factors are excluded.

OTHER COUNTIES include harvested acreage for all counties for which either published data would result in the disclosure of individual operations or acreage totals for specific commodities are of minor importance in the State.

All shipments and unloads, rail, truck, air, and boat, are recorded nationally in 10,000 pound units each day. Annual releases are in 1,000 cwt. In this publication, shipments and unloads for some commodities were converted to most common trading units. Rail and piggyback weights and conversion factors were determined by several Market News Service field offices. Mixed car (rail) loadings by stations have been prorated by commodities.

Where possible, the national Market News Service in Washington, D. C. has established a single uniform weight per commodity to be used nationally in converting to weight units for the various means of transportation. Weights per common container used and number of units per rail car or truck may be obtained by writing Federal-State Market News, 775 Warner Lane, Orlando, Florida 32803.

PRODUCTION AND PRICE UNIT--The official USDA vegetable crop estimates are published on a weight basis. For this bulletin, the official estimates for most vegetable crops have been converted to what is believed to be the most commonly used containers. If changes in container weights are necessary, all data pertaining to the production of the commodity in question are revised to maintain comparability between years. The table below gives the net weight used per container and the number of containers per hundredweight for Florida produce.

Most common unit, estimated net weight, and units per hundredweight, Florida produce, 1996-97 crop season

Commodity	Unit	Est. net weight	No. of units per cwt	Commodity	Unit	Est. Net weight	No of units per cwt
		Pounds				Pounds	
Snap Beans	Bushel	30	3.333	Lettuce, Iceberg	Carton	50	2.000

Lettuce, Boston	Carton	20	5.000				

The value of vegetables, watermelons, potatoes, and berries produced in Florida during the 1996-97 season totaled $1.61 billion, up 7 percent from the 1995-96 value of $1.50 billion. All values of production increased except for snap beans, potatoes, radishes, and other vegetables.

Acreage planted to vegetables, watermelons, potatoes, and strawberries during the 1996-97 season totaled 346,550 acres, down six percent from the 369,600 acres planted during the 1995-96 season. Producers showed increased 1996-97 plantings for snap beans, sweet corn, and strawberries.

The total 1996-97 acreage harvested of 332,600 acres dropped five percent from the previous acreage of 351,100 acres. The areas harvested for snap beans, carrots, sweet corn, and strawberries showed increases from the 1995-96 season.

The average yield per harvested acre was higher for all commercial vegetables with published estimates except snap beans, potatoes, and radishes.

WEATHER HIGHLIGHTS

Below normal rainfall during July, August, and September 1996 in most of the major vegetable producing areas allowed field preparations and planting to stay on schedule. July precipitation totals were one-half inch to over eight inches below normal. In August, only northern and some central localities received above normal rain with most locations recording from an inch to almost ten inches below normal precipitation. September rainfall was normal at a few northern and western Panhandle cities, but ranged from a half inch to almost eight inches below normal over the rest of the State. This dry weather allowed some southern Peninsula growers to enter fields that usually are too muddy to work until October. Growers did delay some fieldwork during early September due to the threat of adverse weather caused by hurricanes Fran and Hortense. Some muckland planting was slowed by heavy rains around Lake Okeechobee in early September, but drier conditions for most of the month allowed growers to get back on schedule. Monthly temperatures averaged normal to two degrees above during July, normal to two degrees below during August, and ranged from two degrees below to three degrees above normal during September. Heavy rain and strong winds from Tropical Storm Josephine on October 7 and 8 affected crop development and slowed fieldwork in all areas except Dade County. Some central and southern Peninsula localities again experienced abundant rainfall as Hurricane Lili passed to the south around mid-October. Most plants recovered from this adverse weather but yield prospects were reduced due to bloom loss and fruit scarring. Milder conditions from late October into early November aided the recovery of plants from storm damage and allowed growers to get fieldwork back on schedule. Producers also replaced fertilizer leached by these heavy rains.

October rainfall averaged from about an inch to almost twelve inches above normal, while most temperatures during the month were within a degree of normal. Cold fronts passing over the Peninsula during early November dropped some temperatures into the 30s and 40s with Dade County and southeastern coastal localities escaping the effects of the cold. Harvesting increased in early to mid-November to meet the late November holiday demand. High pressure to the north and low pressure to the south brought windy weather to most regions around mid-November with temperatures averaging up to eleven degrees below normal. These strong, gusty winds and blowing sand damaged some crops with fruit scarred, plants dehydrated, and foliage burned and broken in many areas. East Coast fields with wind-breaks escaped significant harm from these winds. Warmer, drier weather during late November and most of December accelerated crop harvesting to meet the December and January holiday demand.

For November, rainfall averaged from about an inch to almost four inches below normal, while most temperatures were one to three degrees above normal. Yields were low for some crops due to the gradeout of fruit scarred by the earlier windy weather. The volume of crops picked near the holiday peaked around mid-December. Picking in the Palmetto-Ruskin region slowed seasonally about the middle of December as activity around Immokalee and Dade County increased. Winter cold arrived in all areas after snow fell in some Panhandle and northern localities following mid-month. Lowest temperatures ranged from the 20s in some western Panhandle, northern, and north central areas, to the 50s in Key West. Hard frosts accompanying the cold temperatures brought an end to most crop picking in the north. Most southern Peninsula crops escaped significant damage from the cold weather due to the short duration of near freezing temperatures. Some strawberry growers around Plant City ran overhead sprinklers to protect plants and immature berries. Most cucumbers near

Immokalee sustained significant damage. The cold singed some southern Peninsula tomatoes, squash, snap beans, peppers, cherry tomatoes, and plum tomatoes. Below normal rainfall during December and early January caused many producers to irrigate fields. Warmer temperatures in late December and during the first half of January aided plant recovery.

For December, rainfall averaged from nearly normal to over four inches below, while most temperatures were one to three degrees above normal. Cold temperatures dipped into central localities near the end of the second week in January with thermometer readings in the 30s and 40s. Rain over the southern Peninsula near mid-month delayed fieldwork and lowered the condition of crops. The East Coast region and Dade County reported precipitation accumulations of two to three inches from this rain. The Immokalee area received a half inch or more while the Palmetto-Ruskin area reported a trace to about a quarter of an inch from the rain. Cold weather crept south after mid-month with a record low temperature of 46 recorded at Key West on the morning of January 19. This cold weather caused varying amounts of damage to the winter crop acreage with Dade County and the Immokalee and Lake Apopka areas suffering significant losses. Most acreage in the East Coast region escaped harm, while spring crop planting was just beginning around Palmetto-Ruskin. Warm temperatures and mostly dry weather returned in late January. This helped young acreage to recover from the damage caused by the adverse weather and allowed growers to salvage marketable fruit from older acreage harmed significantly by the cold. In the warmer weather during the days that followed the cold, producers irrigated and applied fertilizer to some damaged fields with a significant amount making a complete recovery.

For January, rainfall averaged from over three inches below to almost two inches above normal, while most temperatures were one to three degrees above normal. Mostly dry and warm conditions persisted throughout February and March. By early February, late winter and spring crop planting was back on schedule with most of the plants killed by the January cold replanted. Gusting winds in late February blew blooms off plants as blowing sand scarred some fruit in Dade County and the East Coast area.

For February, rainfall totaled from a half inch to almost four inches below normal at most official stations with West Palm Beach reporting rainfall about one and a half inches above normal. February temperatures soared from four to seven degrees above normal. Strong winds in early March around Immokalee and in Dade County caused some minor damage. Producers in Gadsden County began planting tomatoes in early March with most starting about mid-month. Gusting winds that accompanied scattered storms in late March caused only minor damage.

For March, most official stations reported rainfall from about a third inch below to over four inches below normal, and temperatures again soaring from four to eight degrees above normal. A cool spell during the last few days of March and the first few days of April helped strawberry development. Warm and mostly dry conditions during most of early April helped Palmetto-Ruskin growers to begin the spring crop tomato harvest. Watermelon cutting began by mid-April in the Southwest and West Central regions. Zellwood growers started picking sweet corn around Lake Apopka after mid-month. Cold fronts passing over the Peninsula brought much needed rain and cooler temperatures beginning about mid-April and continuing through early May. Cloud cover during this period slowed the development of the tomato crop in the Quincy area. Strong winds and heavy rains in late April caused some damage to plants and fruit around Palmetto-Ruskin and in some northern localities.

For April, official stations reported rainfall amounts from two thirds inch to two and one-third inches above normal with Tampa rains being nine and a half inches above normal. April temperatures averaged about normal to three degrees below normal. Cool and mostly dry weather in early May allowed harvesting to proceed at a rapid pace. Producers delayed the picking of squash during early May due to the low market. Scattered storms dropped varying amounts of rain over the southern Peninsula during the last three weeks of May with daily showers arriving statewide by early June. Some localities received hail and wind damage from these storms with a tornado dancing across parts of Miami, including the beach, on May 12. Dade County growers completed most harvesting by mid-May. Commercial picking began to slow in most southern Peninsula areas by the last week of May as north Florida growers increased activity. Tomato harvesting got underway in Gadsden County during the last week of May and the first week of June.

For May, official stations showed temperatures averaging from two degrees below normal in a few central and northern areas to two degrees above in extreme southern localities. Rainfall during May varied from three and one third inches below normal at West Palm Beach to three and two thirds inches above normal at Miami. Daytime highs remained in the 80s during the first half of June with temperatures averaging normal to seven degrees below usual.

Hot weather arrived in the last half of June as daily highs climbed into the 90s. However, June temperature averages were within a degree of normal. The warmer weather coupled with the increasing supply of vegetables from states north of Florida brought most commercial harvesting to an end. Scattered storms

throughout June caused damage in some localities due to strong winds, hail, and tornadoes. June rainfall totaled from about an inch and a half at Tampa to almost twelve inches at West Palm Beach. July temperatures also averaged within a degree or two of normal with most lows in the 70s and most highs in the 90s. Almost daily showers occurred during July and dropped from three to almost eleven inches of rain at the major weather stations. Producers marketed watermelons, sweet corn, Dade County okra, and Gadsden County tomatoes during July, and continued harvesting of vegetables for local sales.

SNAP BEANS

Growers produced 4.0 million bushels of snap beans for fresh market during the 1996-97 season, down 20 percent from the 4.9 million bushels produced last year. Harvested acreage at 28,700 acres for the 1996-97 season was an increase of 3,400 from last season. The 1996-97 yield of 138 bushels per acre was 57 bushels less than a year earlier. The price of $14.51 per bushel was $1.66 less than the 1995-96 record high price of $16.17 and $2.44 more than the 1994-95 price of $12.07. The value of the 1996-97 crop at $57.3 million was down 28 percent from the previous season's value of $79.6 million.

Bush beans are grown in most areas of the State. The southeastern area, mainly Dade and Palm Beach counties, continued as the major production area. Pole beans are grown primarily in Dade County with a small amount grown in some northern counties.

Central and northern area producers began planting their fall crop during late summer. Southwest started planting in late August. Dade County and East Coast started planting in early September. Northern harvest was active in September and October. West Central harvest started in late October. In late October acreage was lost to wet field conditions in the East Coast and Dade County. The lost acreage was replanted. Yields were low during November and December due to beans being damaged by wind scarring from the earlier storms. A freeze on January 19-20, the only freeze in the winter vegetable area for the season, killed most of the beans in the Everglades and Southwest. In Dade County most of the older fields sustained heavy damage from the freeze. On the East Coast the top of some of the plants showed some cold burn but there was no significant plant loss. Most of the lost acreage was replanted. Dade County snap bean harvest was virtually complete by mid-May. East Coast and Southwest harvest was virtually complete by the end of May. West Central harvest was completed by mid-June. The northern harvest was complete in July.

BLUEBERRIES

The acreage of blueberries harvested in 1996-97 was 1,300 acres, the same as last year. Production was an estimated 2,400,000 pounds, with an average yield per acre of 1,850 pounds. The value per pound was $2.50 and the total value of the crop was $6,005,000. Harvesting of blueberries occurs between mid-April and early June. The majority of the acreage is in northern counties of the Peninsula with significant production also in Hardee, Hillsborough, and Manatee counties, as well as in the Panhandle. Both fresh use and processing blueberries are produced.

CABBAGE

Cabbage growers in Florida produced 6.0 million crates and bags of cabbage during the 1996-97 season, up 13 percent from the previous season. The gross value of sales was $42.7 million, up 44 percent from a year earlier. The season average price was $7.16, up $1.57 from the 1995-96 season. Planted acreage totaled 8,100 acres, down 1,300 acres from a year earlier. Harvested acreage amounted to 8,000 acres, down 1,000 acres from the previous year. The average yield of 746 crates per acre was up 157 crates from the previous year. The Hastings area was the leading production area followed by East and West Central areas. Flagler and Manatee counties were the leading cabbage producing counties with 1,800 acres each.

Planting was underway by mid-September in the central area and by early October in the Hastings area. Planting was underway in Dade County by mid-October. Harvest started in the north central area in late November. Harvest started in the West Central area in late December. Hastings and Dade County harvest started in early January. The freeze on January 19-20 caused no major damage to the cabbage crop. Harvest was complete in Dade County by mid-May and in the northern areas by mid-June.

CARROTS

Growers produced 120,300,000 pounds of carrots during the 1996-97 season, up 43 percent from the previous season's 84,000,000 pounds. Yield in-

creased 3,500 pounds per acre from the 15,000 pounds per acre for 1995-96 to 18,500 pounds in 1996-97, a new record high. The previous record yield of 17,000 pounds per acre was dug during the 1992-93 season. Harvested area totaled 6,500 acres, up 900 acres from the 1995-96 acreage. Virtually all carrots were grown in the central muck area around Lake Apopka during the 1996-97 season. The value of carrots sold was $16.4 million, up 31 percent from the $12.5 million producers received for the previous season's crop. The average farm gate price was 13.6 cents per pound, down slightly over a penny from the 14.9 cents per pound averaged in 1995-96. Prices slowly rose from the 12 cents per pound during December, January and February, to 14 cents in March, about 15 cents in April and May, and 16 cents per pound in June. This compared with the 1995-96 monthly price range of 14 to almost 17 cents per pound. About twenty percent of the 1996-97 crop was sold each month from January through March 1997, versus about half sold during March and April the previous season.

Growers got planting underway around Lake Apopka in early September. Rainfall from Tropical Storm Josephine hindered germination in early October. Some heavy rains caused by the southern passage of Hurricane Lili hampered development around mid-October. Warmer, drier conditions during late October aided growth. Most of the acreage escaped major damage from near freezing temperatures during early-to-mid November, and again around mid-December. Significant rainfall in early December caused very little damage to the crop. Digging began about mid-December with growers reporting good quality and yield prospects. Growers reseeded young acreage that the January 19 freeze killed. Older fields sustained only light damage with all recovering well during the balmy conditions in the months of February and March. Growers packed about a third of the volume dug during early April as jumbo grade. Digging continued in the Zellwood area near Lake Apopka throughout May into the first part of June with very good quality harvested.

SWEET CORN

Florida is the Nation's leader in the production of fresh market sweet corn. Value of the 1996-97 sweet corn crop totaled a record high $123,762,000, thirteen percent above the previous high of $109,258,000 attained for the 1993-94 crop, and twenty-four percent above the $99,560,000 for last season's crop. Production at 13,921,000 42-pound crates rose ten percent above the 1995-96 production of 12,692,000 crates. The Everglades region produced 59 percent of the 1996-97 production. The Central area, including growers around Lake Apopka, produced 20 percent of the total bushels harvested in 1996-97. The combined Southeast and Southwest regions produced 13 percent of the 1996-97 bushels picked while growers in northern localities produced the remaining 8 percent. The value per crate averaged $8.89, $1.05 above the 1995-96 average of $7.84 per crate. Growers received record-high prices of $14.24 and $11.09 per crate during March and April, respectively. Prices during 1996-97 ranged from the March high to the July low of $5.29. Growers planted 44,000 acres and harvested 42,100 acres during 1996-97.

Mostly mild weather kept fieldwork and plantings in the Zellwood and northern areas on schedule during July, August, and most of September. Growers delayed some fieldwork during early September due to the threat of adverse weather caused by Hurricanes Fran and Hortense, and due to heavy rains around Lake Okeechobee. However, producers got back on schedule by mid month. Some Zellwood plants were knee to waist high by mid-September. East Coast growers started limited planting during the last half of September. Southwestern, Everglades, and Dade County producers scheduled planting of larger acreage for late September and early October. Northern picking began during late September. Winds caused by Tropical Storm Josephine tossed some plants in southern areas during early October with most foliage recovering. Everglades producers began light harvesting by mid-October. Rainfall from Hurricane Lili caused no significant damage to plants around mid-October, but did delay some fieldwork. The October rains leached some fertilizer from Dade County fields with growers replacing the chemicals after the bad weather passed. The oldest acreage in Dade County started tasseling in late October. Milder weather from late October into early November aided crop development. Windy weather around mid-November tossed some plants in the East Coast region with some laid over. Dade County harvesting began about mid-November. Drier and mostly warm weather from late November until mid-December allowed field-work and harvesting to progress normally. Cold winter temperatures, arriving around mid-December, caused no significant damage to the acreage around Lake Okeechobee and in Dade County. Spring crop planting remained active in the East Coast and Southwest areas during early January. The freeze around January 19 killed all spring crop acreage in the Southwest and burned leaves in some fields around Stuart in the East Coast region. Growers replanted any lost acreage during the balmy conditions that followed the freeze. Heavy rains in the East Coast area that followed the freeze hindered germination of some plantings. Everglades and southwestern producers were planting steadily

by early February. Zellwood growers started planting about mid-February. Planting ended by mid-to-late March in the Southwest area and during early April in the Everglades region. Oldest plants in the Zellwood area were about six inches high by early March and were tasseling by early April. Everglades growers started picking in late March. Zellwood producers began pulling after mid-April. Fields muddied by rains near mid-April hindered picking around Lake Okeechobee. Dade County growers continued picking for the local market during late April and into early May. Above average temperatures and mostly clear skies during January, February, and March allowed the Everglades crop to mature earlier than scheduled with the most of the crop harvested by late May resulting in the late May and June demand exceeding supplies. Zellwood and northern growers continued harvesting into early July.

CUCUMBERS

Fresh market cucumber production totaled 5,175,000 bushels during 1996-97, about three percent below the 5,329,000 bushels harvested during the 1995-96 season. A reduced acreage harvested, from 10,400 to 9,100 acres, caused the drop in production since yield during 1996-97 at 569 bushels per acre averaged 57 bushels higher than the 512 bushels per acre picked during the previous season. The 1996-97 yield sets a new record high and is 17 bushels above the previous record high of 552 bushels averaged per acre during the 1991-92 season. The value of the 1996-97 crop rose 22 percent above the previous season, from $48.4 million in 1995-96 to $59.0 million for the 1996-97 crop. The price received by growers during 1996-97 averaged a new record high of $11.40 per bushel, 24 cents above the previous high of $11.16 per bushel realized for the 1990-91 crop. Growers marketed over half of the crop during March, April, and May 1997. Growers in the East Coast region accounted for 49 percent of the State's production, followed by 28 percent from the Central region, 18 percent from the Southwest, and five percent from the North.

Growers in northern and West Central localities began planting during August. Producers along the Southeastern coast started planting in early September. Southwestern growers commenced planting about mid-September. Several growers planted on plastic used for vegetables in prior quarters. Some growers delayed planting until receiving funding, and did not begin planting until October. Harvesting of a very limited northern acreage began in late September. Strong, gusty winds and blowing sand during mid-November damaged some early winter crop acreage with plants dehydrated and foliage burned and broken in many areas. East Coast fields with wind breaks escaped significant harm from these winds. Most southern Peninsula plantings escaped significant damage due to the short duration of near freezing temperatures as winter cold arrived after mid-December. However, some acreage near Immokalee sustained significant damage from the December cold. Warmer, drier weather from late November through the first half of January boosted plant growth and fruit development. Southwestern producers finished winter crop planting by the end of December. Freezing temperatures around January 19 significantly damaged plantings with crop covers protecting most acreage along the Southeastern coast and in the Southwestern area. East Coast growers continued harvesting during late January. Spring crop planting started in the Palmetto-Ruskin and Southwest regions during early February. Picking of a small acreage in the Southwest was completed by mid-February. Strong winds in late February tossed vines in the East Coast area with some blooms lost and fruit scarred. Planting in the Southwest ended in early February as harvesting got underway. Some fruit did not meet grade in the East Coast region during late March due to earlier wind damage. Palmetto-Ruskin growers finished planting by late March with picking beginning during early April. Cooler temperatures around mid-April slowed crop development in the East Coast region. Wind gusts during the mid-to-late April storms tossed plants with windborne sand reducing the quality of some fruit in the West Central and Southwest regions. Harvesting slowed over the southern Peninsula during May as northern producers started picking. Some West Central producers turned over acreage to the U-Pic market by mid-May. East Coast growers finished picking by late May with Southwestern producers completing harvesting by early June. Northern growers continued picking through early July.

EGGPLANT

Eggplant production during the 1996-97 season totaled 1,554,000 bushels. This was up 7 percent from the 1995-96 season. Yield averaged 863 bushels per acre, 169 bushels more than the previous season's yield. Acres harvested totaled 1,800 compared to 2,100 acres harvested the previous season. The value of production at $13,399,000 increased 2 percent from the 1995-96 value of $13,146,000. The price growers received for the 1996-97 crop averaged $8.62 per bushel, $0.40 per bushel lower than the previous price of $9.02. Most of the eggplant production continues to come from the Southeast area of the State.

Planting started in East Coast areas in early August, blooming followed in mid-September with the oldest acreage setting fruit in late September. Harvest began near mid-October with initial cuts yielding fancy, choice grades of mostly good quality. Blowing sand and strong winds caused some leafburn, scarred fruit and increased bloom loss in November and January. However, weather and growing conditions were mostly favorable for eggplant. Yields, color, and quality were good for the season. Harvest finished in late June.

ESCAROLE-ENDIVE

Escarole and endive production during the 1996-97 season at 1,164,000 crates decreased fifteen percent from the 1,373,000 crates produced the previous year. Yield at 727 crates per acre averaged 22 percent or 130 crates higher than the 1995-96 yield of 597 crates. Acreage harvested at 1,600 acres equaled the record low acreage harvested during the 1994-95 season and dropped 30 percent or 700 acres below the 2,300 acres harvested during 1995-96. The average price growers received at $5.96 per crate rose by $1.26 from the $4.70 received during the previous season. The value of the 1996-97 crop totaled $6,938,000, up eight percent or $489,000 from the $6,449,000 realized during the 1995-96 season. Monthly prices averaged $5.96 per 25-pound crate compared with the 1995-96 average of $4.70 per crate. Marketings peaked during January and again during April with over twenty percent of the crop sold each month.

Escarole and endive grow mainly in two areas of muck soils, the Central area which is located northeast of Lake Apopka near Zellwood, and the Everglades area located around the southeast side of Lake Okeechobee.

Planting in the Everglades was delayed by wet soils during the first half of September, but was well underway by mid-month in both the Zellwood and Lake Okeechobee areas. Producers got harvesting underway around Lake Okeechobee in early to mid-October and around Lake Apopka in late October. Heavy rainfall caused by Tropical Storm Josephine and Hurricane Lili in early to mid October damaged some plants with most recovering well in the milder weather from late October into early November. Most plants recovered well from the cool, windy conditions around mid-November and the cold temperatures arriving in mid-December. Warmer, drier weather during late December and early January accelerated crop development and allowed fieldwork to progress normally. The January 19 cold temperatures singed the leaves but virtually all plants made a full recovery. Supplies remained light through February, but started increasing in early March. Harvesting was very active by early April around Lake Apopka and Lake Okeechobee. Harvesting of good supplies continued throughout April with a declining volume available during May.

BELL PEPPERS

The 1996-97 production totaled almost 23 million bushels, 21 percent above the previous season's production of 19 million bushels and the second largest production of record. This increased production reflects the use of new, higher yielding varieties over the past several years and the largest fall crop of record, up 47 percent from the 5,550,000 bushels picked during the fall of 1995, to 8,172,000 bushels harvested during the fall of 1996. This fall production is four percent higher than the previous record of 7,832,000 bushels picked during the fall of 1993. Yield increased to 1,210 bushels per acre, 273 bushels or 29 percent above the 1995-96 season's 937 bushels per acre harvested. The 1996-97 yield is the highest of record, 103 bushels above the previous record-high 1,107 bushels picked during the 1993-94 season. The Southwest region accounted for 40 percent of the total bushels harvested, followed by the Southeast with 35 percent, and the Central area with 23 percent. The western Panhandle and northern Peninsula counties make up the remaining two percent. Acreage picked during the 1996-97 season totaled 19,000 acres, six percent or 1,300 acres below the 20,300 acres harvested during the 1995-96 season. Producers received an average of $10.05 per bushel for the 1996-97 crop, 29 cents higher than the $9.76 per bushel obtained for the 1995-96 crop. The 1996-97 price was the third highest of record and averaged $2.04 below the record-high price of $12.09 per bushel attained during the 1990-91 season. The value of the 1996-97 crop totaled $230,925,000, 24 percent above the 1995-96 value of $185,672,000. The total value of the 1996-97 crop is the highest of record and compares with the previous record of $219,838,000 received for the 1993-94 crop. Prices stayed above $9.00 for all months except October, December, and June.

Pepper plantings were underway in the East Coast region during the last half of July with producers in the Southwest and Palmetto-Ruskin areas starting by mid-to-late August. Drier than normal fall weather kept plantings on schedule throughout September with some growers able to plant acreage in September that they usually do not plant until October. Fruit began to set about mid-September in the oldest fields along the southeastern coast and by late September in southwest-

ern and West Central localities. Northern picking got underway in early October. Rainy, windy weather from Tropical Storm Josephine making landfall in early October, harmed some foliage and reduced yield prospects by blowing off blooms. East Coast growers started picking by mid-October. Heavy rainfall again reduced crop prospects in some central and southern Peninsula localities when Hurricane Lili passed through the Florida Straits about mid-October. Drier weather from late October through early November allowed most plants to recover. Fruit started reaching maturation in southwestern fields by late October with harvesting underway by early November. Windy, cooler weather during mid-November slowed fruit setting and sizing, caused foliage to burn, increased bloom loss, and scarred some fruit in southern fields. However, fields around Immokalee escaped significant damage although wind-borne sand scarred some fruit. Picking of the Palmetto-Ruskin crop got underway during late November. Milder weather from late November into early December boosted crop development and allowed transplanting to proceed on schedule in the East Coast and Southwestern regions. Cold winds near mid-December again caused some crop damage with most plants recovering well in the warm and dry conditions existing from late December into early January. Mild weather during the first part of January boosted plant growth of young fields in the East Coast and West Central regions. The freeze around January 19 burned older plants halfway down the main stalk with producers making salvage harvests from these fields through February. Young plants escaped significant cold damage. Most acreage in the East Coast area was not affected by the cold temperatures with growers making spot resets of a minor amount of young plants killed by the freeze. Producers in the West Central and Lithia areas replanted fields killed by the cold with some acreage recovering well in the balmy conditions that followed. Transplanting started about mid-February in Sumter County. West Central and East Coast growers finished spring planting by late March. Harvesting was underway by early April in the West Central area. Dry soils prompted Sumter County producers to irrigate in early April. Storms interrupted picking in many southern Peninsula localities beginning around mid-April but caused no significant delays. Warm temperatures during late May and during the first half of June stressed plant growth in some East Coast localities. Picking started to slow in the Immokalee area by mid-May with harvesting finished by early June. Growers in the Palmetto-Ruskin region began to open fields for U-Pic harvesting about mid-May with activity proceeding into July. East Coast growers finished picking by mid-June. Northern producers began spring crop harvesting during late May with activity continuing through late June into early July.

POTATOES

Florida potato production during 1997, including both winter and spring, totaled 8.1 million cwt. This was 15 percent less than the 1996 crop. A total of 43,500 acres was planted for harvest in 1997, down 7 percent from the previous year. Out of this total 42,100 acres were dug, down 5 percent from 1996. The value of the crop was placed at $97.7 million, down 23 percent from last year. The price received for all potatoes averaged $12.00 per cwt compared with $13.20 in 1996. The yield for all potatoes was 194 cwt per acre, down 23 cwt from the previous year.

The first potatoes were planted in the Southwest area around early October. In Dade County potato planting got underway in early November. Planting ended in both the Southwest and Dade County in January. Planting started in the West Central area in late November and ended in late January. On January 19-20 in the Southwest a freeze killed most of the plants in the potato fields. In Dade County the potatoes had leaf burn from the freeze. Heavy rains during the winter damaged the Dade County crop. Blight was also a problem in the Dade County potato fields. In the West Central the growers were able to cover the potato plants so they were not killed by the January freeze. Harvest started in the Southwest and Dade County in early February. The West Central areas harvest started in late February. Harvest was complete in Dade County, Southwest, and West Central areas in late May.

In the Hastings area, the largest area of potato production area in Florida, planting started in late December and ended in mid-March. The January 19-20 freeze did major damage only to the early planted potatoes in the Hastings area that were too large to cover. Hastings potatoes were actively being harvested by mid-April. Harvesting in the Hastings area was virtually complete in early June.

The "red-skinned" varieties are the dominant potatoes grown for winter harvest in south Florida. Most of the winter crop is sold for table stock. In the Hastings and the other spring areas, the "white-skinned" varieties dominate. Most of the Hastings production goes to the potato chip industry. Most of the Hastings production is used to produce potato chips.

RADISHES

Production of radishes in Florida totaled 3.6 million cartons in 1996-97, down 25 percent from the previous season. (A carton of radishes is 15 pounds.) The area for harvest was 10,600 acres, down 15 percent from the 1995-96 season. This is also the lowest acreage

of record. The yield was 340 cartons per acre, down 50 cartons from last season. The average season value per carton was $4.95, up 81 cents from the 1995-96 season. The value of annual production was $17.8 million, down 11 percent from the previous season.

Seedings for the 1996-97 crop were underway by early September in the Central/Zellwood and Everglades areas. Harvest started in the Central area and the Everglades in late October. Planting and harvest were occasionally delayed by wet weather during the remainder of the season. The freeze in mid-January killed virtually all the radishes on the muck in Zellwood. In the Everglades the freeze caused significant losses. Fields at Zellwood planted on sand land in protected areas suffered very little loss. Harvesting in the Everglades area was complete in late May and by the end of June in the central area.

SQUASH

The harvested area of squash in the 1996-97 season was 8,500 acres, down 11 percent from the previous season. This was the lowest acreage since the 1969-70 season. Production reached 2.4 million bushels, up 20 percent from last season. (A bushel of squash equals 42 pounds.) The yield was 285 bushels per acre, up 75 bushels from the 1995-96 season. Shipments to out-of-State markets had two peaks, a fall peak in November and a spring peak in April. The average price for the season was $11.66 per bushel, down $1.88 from last season. The total value of the crop was $28.2 million up 3 percent from the 1995-96 season.

Florida produces acorn, butternut, yellow crookneck, yellow straightneck, white, and zucchini squash. The Southeast region accounted for 66 percent of the State's production, with the Southwest producing 16 percent of State's total.

Planting of the southwest and East Coast fall crop was active during early September. West Central planting was underway by mid-September. In Dade County planting was active in late September. Harvesting in the north was active in early September. East Coast harvesting started in late September. Hurricane Opal did no major damage to the squash crop. West Central harvest started in mid-October. Dade County harvest started in late October. West Central fall harvest was virtually completed by late December. The mid-January freeze killed or heavily damaged most of the old squash plants in the winter vegetable areas. Most of the youngest plants survived the freeze. The lost acreages were replanted. The harvest was complete in southern areas by late May and in the North by the end of June.

STRAWBERRIES

Production of strawberries reached 14,742,000 flats in the 1996-97 season, up from the 13,000,000 flats in the 1995-96 season. Area harvested was 6,100 acres, up from 6,000 acres the previous year. Yield was 2,417 flats per acre, up from the 2,167 flats last year. (A flat of strawberries equals 12 pounds.) The value of the 1996-97 strawberry crop was $146,119,000 up 30 percent from the 1995-96 crop. The price per flat at $9.91 was up from the 1995-96 price of $8.66 per flat.

The major production area continues to be in Hillsborough County, centered in the Plant City-Dover area. A significant amount of U-Pic acreage is grown in Dade County and the East Coast area. Planting began in late September and was completed by the beginning of November. Major varieties include Oso Grande, Selva, and Sweet Charlie. Harvesting started in late November, peaked in February, and continued into April.

TOMATOES

The value of the 1996-97 fresh market tomato crop totaled $462.5 million, up $18.1 million or four percent from the 1995-96 value of $444.5 million. Although acreage harvested at 37,300 acres decreased by 8,200 acres from the 45,500 acres picked the previous season, yield per acre rose by 218 cartons, from 1,250 cartons per acre for the 1995-96 crop to 1,468 cartons during 1996-97. The estimated acreage includes round and plum or pear varieties and U-Pic acres. The value per carton at $8.45, f. o. b. basis, was 63 cents higher than the $7.82 per carton growers received for the 1995-96 crop. Average prices during 1996-97 ranged from a high of $14.70 per carton in March to a low of $6.58 per carton in April. Prices increased from October through most of March, dropped in April, and again rose in May and June, reflecting competition from areas outside of Florida.

Planting began around Quincy about mid-July with most acreage in the ground by early August. Transplanting started around mid-August in southern Peninsula areas. Dade County growers commenced planting during the last half of September. The drier than normal fall weather allowed planting and spraying for disease control to proceed on schedule. Harvesting began around Quincy during late September with most growers starting to pick in early October. Some southern growers delayed planting until they received funding. Heavy rains and strong winds spun off as Hurricane Lili passed through the Florida straits around mid-October, increased bloom drop which lowered the late fall and early winter crop yield potential.

The Palmetto-Ruskin area escaped significant damage from this storm as picking of the fall crop began. Southwestern and southeastern growers started harvesting during late October and early November with dry, warm weather speeding progress. Cold, windy weather around mid-November caused fruit scarring, plant dehydration, and foliage to burn and break in many southern localities with most younger plants escaping significant damage. Mild weather allowed fieldwork to progress on schedule from the last part of November through most of the first half of December. Dade County growers started picking a very small acreage in early December. Heavy rain at the end of the first week of December slowed some activity in all southern areas. Most southern Peninsula acreage escaped damage from the winter cold spell that arrived after mid-December. Warm and mostly dry weather during late December and early January aided plant growth and development with harvesting near the peak level to meet the holiday demands. Below normal rainfall during December prompted most producers to irrigate fields. Picking in the Palmetto-Ruskin area was virtually completed by early January. Freezing temperatures around January 19 significantly damaged most plantings. Growers made spot resets for those plants completely killed by the cold with only a small acreage completely lost. Supplies during February and most of March were limited with a lot of fruit not meeting grade due to the effects of the January freeze. Nearly ideal weather from late January through early April helped plants damaged by the January cold to recover completely.

January 1997 Freeze Losses for Florida Tomato Acreage

	All Acres	Palmetto-Ruskin	Southwest
Acres Lost	1,876	331	1,545
Acres Not Replanted	175	0	175
Acres Replanted	1,701	331	1,370
Percent Replanted	91%	100%	89%

Transplanting was finished in Dade County during early January; in the Southwest area, by late February; and in the Palmetto-Ruskin and East Coast regions, by mid-March. Producers in the Quincy area began planting in early March with ninety-five percent of plantings in the ground by early April. Growers began picking some of the freeze damaged acreage in late March with abundant supplies available throughout April. Oldest plants in the Quincy area started blooming about mid-April. Wind, water, and hail accompanying storms during the last half of April damaged some plants and fruit in the Palmetto-Ruskin and Southwest regions. Some plants were covered by water in the Palmetto-Ruskin area due to heavy downpours from these storms. Acreage in Gadsden County escaped significant damage from these storms although strong winds dehydrated plants. Dade County producers turned most acreage over to pinhookers in late April with most harvesting completed by early May. Cloudy weather kept temperatures cooler than normal around Quincy during late April and early May, which slowed crop development. The cool, dry weather continuing into early May allowed picking to proceed at a rapid pace with Dade County growers finished by the first full week of May. Storms during the last three weeks of May slowed some harvesting and increased fruit gradeout due to rain and sun damage. Southwestern growers completed harvesting in late May with some fruit from other areas continuing to be packed in Immokalee. Picking got underway in Gadsden County during the last week of May and the first week of June with virtually all first picks made by mid-month. East Coast growers finished picking about mid-June. Palmetto-Ruskin producers continued harvesting through mid-to-late June. Growers around Quincy harvested about half of the production during the first three weeks of June. All picking for out of state shipments was completed by early July.

WATERMELONS

Production during the 1996-97 season totaled 7.5 million cwt, up 5 percent from the 7.1 million cwt produced last season. Harvested acreage totaled 30,000 acres, down 12 percent from the previous season. The average yield was 250 cwt per acre, up 40 cwt from the 1995-96 season. Value of production was $54.8 million, up 10 percent from last season. Growers received $7.30 per cwt, up 30 cents from the previous season.

Southern counties accounted for 23 percent of the production and 23 percent of the harvested acreage. Hendry was the largest county in the south and number two in the State with almost 9 percent of the State's harvested acreage. Northern counties account for 51 percent of the production and 46 percent of the acreage. Alachua County had the largest acreage in the State with more than 10 percent of the acreage. Central counties had 19 percent of the production, led by Manatee County with almost 7 percent of the State's harvested acreage. Western counties had 7 percent of the production and more than 11 percent of the State's harvested acreage.

A small acreage for harvest during the fall is grown in southern localities and in scattered areas of north and central Florida. These melons are harvested in

October, November, and December depending on weather conditions. This acreage and production is included in the spring crop.

Fall crop plantings began during the summer of 1996 around Palmetto-Ruskin and in scattered areas of north and central Florida. The fall harvest was underway in the north in early October and started in the Palmetto-Ruskin and central areas in mid-October. Fall harvest ended in late December. Planting of the spring crop in the southwest started in mid-January and was complete by early March. The mid-January freeze did little damage to the watermelon crop as most of the acreage was not up. Growers replanted the lost fields. Planting in the Palmetto-Ruskin area started in early February and was complete by mid-March. Planting in North Florida started in early March. Harvest in the southwest was underway by mid-April. West Central harvest started in mid-April. Harvest in the North was underway in late May. Harvest in the Southwest ended in early June. The Central harvest was completed in June. Northern and Western harvest were active into July.

OTHER CROPS

Cantaloupes are grown in Florida primarily in the spring and summer in the Southwest and North Central areas. Some cantaloupes also are grown during the fall months in the Southwest and West Central areas. The peak harvest period is normally May and June. Much of the production is sold through roadside stands and local markets.

Cauliflower is grown in the North Central and West Central areas. Supplies are available from late November through early May.

Celery production is located mainly in the Central Florida area around Zellwood and in the Everglades, with the Everglades area producing the larger share. Transplanting usually starts by early September and harvest runs from November through June. Due to the limited number of producers growing celery, the Florida Agricultural Statistics Service has discontinued publishing acreage, yield, and price statistics.

Tropical vegetable production is centered in Dade County. The most common tropical vegetables followed by the scientific name in italics and other names in parentheses are: boniato-*Ipomea batata* (sweet potato); calabaza-*Cucurbita* (pumpkin); malanga-Xanthosoma caracu or (dasheen, yautia); and cassava-*Manihot esculenta* (crantz, yucca, tapioca). Boniato, calabaza, and malanga constitute the bulk of production. Peak production of malanga occurs in February through April. Efforts are being made to provide more even supplies throughout the year. Miami and the Tampa Bay areas are important points of consumption for the Florida production. The supplies shipped out of State are primarily for the New York City and Philadelphia areas.

Collard, turnip, mustard, and other greens are grown throughout the State and centered around large population areas and in the muck soils of the Everglades and Zellwood areas. Supplies are available for local consumption throughout the year.

Okra is grown in many areas of the State. Dade County produces okra for local use as well as for shipments to other States. Peak production is in May and June with a good supply in October and November.

Green onions and leeks are produced in the North Central and West Central areas. Supplies are marketed primarily at roadside stands and markets for local use, but there are several large producers who ship to other States.

Most of the **dry onions** are produced in southern and west central areas of the State.

Parsley is available in both the curly and plain types. The bulk of the commercial volume shipped to other States is produced in the Everglades and Zellwood areas. Light supplies sold for local use are available from Sarasota, Lake Placid, and other areas.

Southern peas are grown primarily in the West, North, West Central, and Everglades areas of Florida. Dade County also produces a considerable amount of southern peas. Light supplies are generally available from September through December. Heavy movement is spread out from November through May. A high percentage of the crop is utilized for processing, though a part of the crop is sold through local markets for fresh use.

Chinese Cabbage is grown primarily on the muck-lands in the Everglades area with minor production in the Zellwood/West Central areas. Harvest began in October and continued through early June.

VEGETABLES, WATERMELONS, POTATOES, AND BERRIES

Acreage, yield, production and value, Florida, crop years 1995-96 and 1996-97

Crop	Planted acreage		Harvested acreage		Yield per acre	
	1995-96	1996-97	1995-96	1996-97	1995-96	1996-97
	Acres				Cwt

The USDA Pesticide Data Program funded the survey that provided the information in this publication. The purpose of the program is to upgrade the reliability of pesticide use statistics and the quality of information on pesticide residues in food. Four USDA agencies administer the program to collect and analyze pesticide data regarding actual concentration levels in food, beginning with fresh fruits and vegetables. This data series addresses the increased public interest in agricultural chemical use and provides the means for government agencies to respond effectively to food safety and water quality issues.

Primary data used in making chemical use estimates were obtained from a probability survey conducted in the fall of 1996. A total of 9 vegetable crops plus watermelons and strawberries were included as target crops in the survey.

Enumeration was by personal interview. A sample of 523 producers was contacted during the enumeration period. A full year of chemical application data was collected dealing with the 1995-96 crop year. A thorough review compared reported data with manufacturer's label recommendations and with data from other producers. Following this review, product information was converted to an active ingredient level. The chemical usage estimates in this publication consist of survey estimates of those active ingredients.

CONFIDENTIALITY OF COLLECTED DATA

All information collected from individual agricultural producers is held strictly confidential. Data provided by individual producers or other agricultural firms are used only to compile and publish statistics at the county, State, and national levels. Statistics at the county and State level are not published if they will potentially disclose information about an individual or operation. In addition, all names and addresses obtained by this office are held confidential.

RELEASE DISTRIBUTION POLICY

Florida Agricultural Statistics Service (FASS) publications are provided free of charge to all Florida agricultural producers and other respondents to FASS surveys. Also entitled to free FASS publications are news media that use agricultural statistics in their publications, cooperating State agencies, and other USDA agencies that have an essential need for this information. Publications picked up at the FASS office will be provided at no charge. Most FASS publications are available on the Internet. Users may access and download these reports from our homepage: http://www.nass.usda.gov/fl

Other persons or entities will be assessed a nominal charge to receive individual publications or to be placed on distribution list for future FASS publications.
